Abstract

a1
In connection with the determination the transmit power of a beginning transmission there is also determined, in the method according to the invention, suitable output powers for other transmissions, so that the entity formed by all controlled transmissions is as close to the optimum as possible already at the beginning of a new frame. The method according to the invention takes into consideration the effect of a beginning transmission on other transmissions. The method according to the invention further takes into consideration changes in the conditions during the previous frame by including the control history of the fast power control as initial information of the calculation made during the re-determination of the output powers, for instance as a suitable statistical quantity of the transmission history of each transmission, for instance as an average over a certain period.

IN THE CLAIMS:

Please cancel Claims 11 and 14 without prejudice.

Please replace the following claims as rewritten below:

a2
1. (Amended) A power control method in a mobile system based at least partly on a spread spectrum technique and having at least one mobile station and at least one base station, characterised in that the transmit power of more than one bearer is determined
